

Readme for replication package of “Efficient Estimation for Staggered Rollout Designs”, by Roth and Sant’Anna, published in JPE: Micro

The code in this replication package constructs the analysis file from Roth and Sant’Anna (2023). Our replication package contains two separate zip files: `RS_Staggered_simulations.zip` and `RS_Staggered_application.zip`. `RS_Staggered_simulations.zip` contains all the codes and results of our Monte Carlo simulation exercises, while `RS_Staggered_application.zip` contains all the codes to replicate our empirical application. The entire analysis was conducted in R. In what follows, we explain each of these folders separately.

1 Simulation Files

Once unzipped, the `RS_Staggered_simulations` folder contains several sub-folders. We recommend using the RStudio project file, `Staggered_Simulations_SR2022.Rproj`, to navigate the replication files for the simulations. These files are also available on Github, at https://github.com/pedrohcg/RS_Staggered_simulations.

In what follows, we describe each folder and its contents:

1. **Codes:** Contains all the codes to run the simulations.
 - (a) `1_simulations-using-wood-et-al-functionalized.R` contains codes to run all the simulations based on Wood, Tyler, Papachristos, Roth and Sant’Anna (2020b) in Azure. In order to successfully run this code, you need to set up an Azure account. We recommend following the steps provided here: <https://github.com/Azure/doAzureParallel>. This would require you to set the credential via the `credentials2_anonymous.json` file in the parent folder. Since this can be time-consuming, we have saved all simulation results into the `Temp/Wood-et-al-sims/` folder.
 - (b) `2_simulations-using-wood-et-al-graphs-functionalized.R` contains code to analyze all the simulation results generated in `1_simulations-using-wood-et-al-functionalized.R`. It creates the tables and saves them at `Tables/Wood-et-al-sims/` folder. This code can be successfully run using the saved simulation results, without running step 1.
 - (c) `3_simulations_two_periods.R` contains codes to run all the simulations based on the simple setup with two periods and two groups in Azure. We have saved the simulation results into the `Temp/` folder as `2period-sim-results.rds`.

- (d) `aux_fte_theme.R` contains auxiliary code to fix the style of plots.
 - (e) `aux_simulation_functions.R` contains auxiliary code to run the simulations in the simple case with two periods and two treatment groups.
2. **Data:** Contains the dataset used by Wood, Tyler and Papachristos (2020a) and expanded in Wood et al. (2020b). These files are also available at https://github.com/george-wood/procedural_justice and https://github.com/george-wood/procedural_justice_revisited, respectively. We keep them here so everything is self-contained. We use these files in our simulation based on Wood et al. (2020b).
 3. **Tables:** Contains the output tables for all the simulations.
 4. **Temp:** Contains “temporary” files, which, in our context, are simulation results generated by the codes in the `Codes` folder.

2 Application

Once unzipped, the `RS_Staggered_application` folder contains several sub-folders. We recommend using the RStudio project file, `RS_Application.Rproj`, to navigate the replication files for our empirical application revisiting Wood et al. (2020b). These files are also available on Github, at https://github.com/pedrohcg/RS_Staggered_application.

In what follows, we describe each folder and its contents:

1. **Codes:** Contains all the codes to replicate the empirical application.
 - (a) `00_run_all.R` is the master file that calls all the other codes and replicates the entire analysis.
 - (b) `01_main_wood-et-al-no-special_ops-no-pilot.R` contains the main codes to replicate our analysis. It replicates Figure 1 and Table 5 of the main text, Figures C.1, C.2, and C.4 in the Appendix.
 - (c) `03_balance_checks_pre_tests.R` contains codes to do the balance tests and reproduces Table 6 of the main text and Table C.1 in the Appendix.
 - (d) `04_balance_on_age.R` contains codes to do the balance tests on age and reproduces Figure C.3 in the Appendix.
 - (e) `aux_fte_theme.R` contains auxiliary code to fix the style of plots.

2. **Data:** Contains the dataset used by Wood et al. (2020a) and expanded in Wood et al. (2020b). These files are also available at https://github.com/george-wood/procedural_justice and https://github.com/george-wood/procedural_justice_revisited, respectively. We keep them here so everything is self-contained. We use these files in our simulation based on Wood et al. (2020b).
3. **Tables:** Contains the output tables for all the models and specifications.
4. **Figures:** Contains the output plots for all the models and specifications.
5. **Temp:** Contains “temporary” files, which, in our context, are the empirical results generated by the codes in the Codes folder.
